

Infinite Computable

Assignment Project Exam Help

<https://powcoder.com>

Not a new concept

Add WeChat powcoder

What does infinite mean?

- The concept of infinity exists in our minds

Assignment Project Exam Help

- Does **infinity** actually exist?

<https://powcoder.com>

- What does **actually** mean?

Add WeChat powcoder

Is it a physical embodiment?

Between any two **locations** in space there is a third location?

Or after every **moment** in time there is a next moment?

Cogito

- As a concept, no doubt it (infinity) exists

This is why it was given a name in the first place

Assignment Project Exam Help

<https://powcoder.com>

- The same applies for:

Add WeChat powcoder

circle

straight line

Even a point

Almost everything

Can computers handle infinity?

- What do you mean by handle?

Assignment Project Exam Help

- What do you mean by computers?

<https://powcoder.com>

- Alright, computers are Turing Machines

Add WeChat powcoder

Can Turing Machines handle infinity?

- Still, what do you mean by handle?
- Do you mean save (encode) the whole set in the TM's memory?
- Well, they have infinite tapes.

Assignment Project Exam Help

<https://powcoder.com>

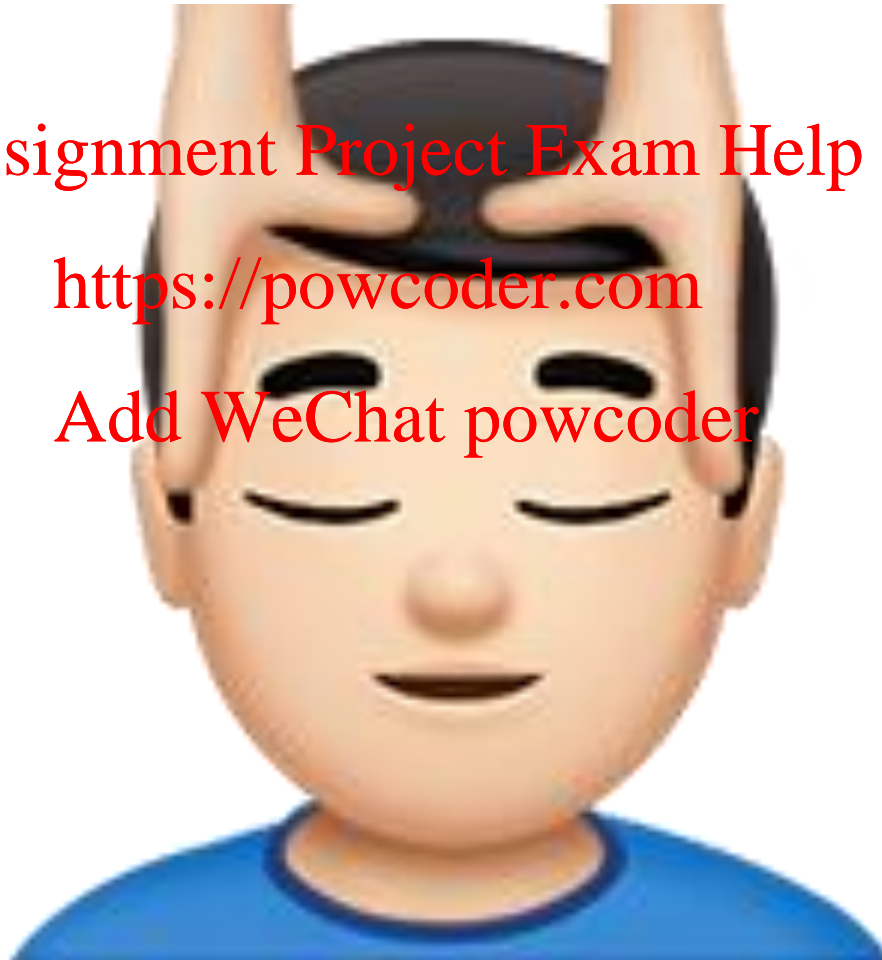

Add WeChat powcoder

Can a **PHYSICAL** computer handle ∞ ?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Can a physical computer handle an infinite set?

- If you mean save all of it, then according the physics we know so far,
NO

Assignment Project Exam Help

- We don't need to save a whole set

<https://powcoder.com>

Add WeChat powcoder

- Computability is about answering membership questions

Example

- The set of numbers divisible by 5 exists as a concept

Assignment Project Exam Help

- You can write a program, which can work for any given natural input, to tell us if the given number is divisible by 5 or not.

<https://powcoder.com>

Add WeChat powcoder

Simply, look at the first digit from the right and check if it is 0 or 5.

Did we forget something?

- What does it mean to be **given** a number

Assignment Project Exam Help

- What if the number is too large to be saved as an input

<https://powcoder.com>

- Might take forever to find where it starts

Add WeChat powcoder

TM's are the best

- Tell me about a better way to talk about computers with arbitrary capacity

Assignment Project Exam Help

- TM's for physical computers, are like the Circle for the sun

<https://powcoder.com>

Add WeChat powcoder

- The first is an ideal concept which smoothens a physical entity
- Or maybe the second is a rough physical manifestation of an ideal reality

Final words on infinite sets

- Handling infinity is problematic regardless of the whole computers talk

Assignment Project Exam Help

- Even problematic regardless of any physical realizations

<https://powcoder.com>

Add WeChat powcoder

- Check The axiom of choice

Sets

- Set: Collection of objects (distinct)

Note that this is an informal definition. If interested in some formalism, and why it is needed, look into axiomatic set theory (would be a whole new course).

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- Those objects inside a set can be sets themselves (sets of sets)
- Fun fact: natural numbers can be interpreted as sets

Functions

- Formally, a function f from a set X to a set Y is **the set** of ordered pairs (x, y) such that x is in X , y is in Y and every element in x is the first component for exactly one ordered pair.

<https://powcoder.com>

- Informally, a function is a process, and what we mentioned above is called the *graph* of the function.

- X above is called the domain
- A sequence (or string) is a function with domain \mathbb{N}

Finite and Infinite Sets

- Informally, a set is finite if you can count it and finish

Assignment Project Exam Help

- Formally, S is finite if there exists a natural number n , and an injective function $f: S \rightarrow \{0, 1, \dots, n\}$

<https://powcoder.com>

Add WeChat powcoder

- A set is infinite if it is not finite.

Or equivalently: S is infinite if there is an injective function $g: \mathbb{N} \rightarrow S$

Cardinality

- Two sets are said to have the same cardinality (equinumerous) if there is a bijection between them

Assignment Project Exam Help

- The cardinality of a set A is denoted by $|A|$

<https://powcoder.com>

Add WeChat powcoder

- A Cardinality is actually an equivalence class of the relation of equinumerosity

Comparing Cardinalities

- $|A| \leq |B|$ if there is an injection (injective function) from A to B .

Assignment Project Exam Help

- Such injection could be a bijection, in which case we have $|A| = |B|$

<https://powcoder.com>

- For every set S , the set $P(S)$ (of all subsets of S) has a strictly larger cardinality than S . I.e. $|S| < |P(S)|$ (there is no bijection)

Add WeChat powcoder

Some sets are more infinite than others

- $|\mathbb{N}| < |P(\mathbb{N})| < |P(P(\mathbb{N}))| < \dots$

Assignment Project Exam Help

- A set A is countable if $|A| \leq |\mathbb{N}|$ (so it can be finite or infinite)

<https://powcoder.com>

- A set A is uncountable if it is not countable.

Add WeChat powcoder

In other words, if there is an injection of the natural numbers into A , but no injection of A into the natural numbers.

- Clearly uncountable is always infinite

The Continuum Hypothesis (just for fun)

- Can you find a set $|A|$ such that $|\mathbb{N}| < |A| < |P(\mathbb{N})|$?

Assignment Project Exam Help

Ans: Yes and No

<https://powcoder.com>

Add WeChat powcoder

- Don't mix computable, countable, uncountable, not computable
- Uncomputable = non-computable = not computable
- In the realm of computability, WLOG, we will only be dealing with countable sets (subsets of \mathbb{N})
- Recall, recursive functions and Turing machines deal with objects which can be coded as natural numbers

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Back to where we finished

Assignment Project Exam Help

last lecture

<https://powcoder.com>

Add WeChat powcoder

- We saw how we can give programs numbers (e.g. via Gödel numbering)

Assignment Project Exam Help

- We let P_e denote the e^{th} Turing program, and φ_e the corresponding partial computable function (in one variable)
- This implies that the set of all Turing Machines is countably infinite (infinite and countable)

The Universal Turing Machine

- There exists a TM U which if given input (e, x) it runs the e th TM with input x .

Assignment Project Exam Help

- Follows from CT

<https://powcoder.com>

Add WeChat powcoder

Infinite Computable

- A set is infinite computable if it is infinite and also computable

Assignment Project Exam Help

- Red V neck T-shirt: A T-shirt which is red and has a V neck
<https://powcoder.com>

Add WeChat powcoder

Infinite Computable is Diophantine

- Indeed, Diophantine = C.E.

Assignment Project Exam Help

- Computable \gg C.E.

<https://powcoder.com>

- Thus, Computable \gg Diophantine

Add WeChat powcoder

- Infinite & Computable \gg Diophantine

The empty set is computable

- It is finite and every finite set is computable (why?)

Assignment Project Exam Help

- Or more directly: the characteristic function of the empty set is the zero function which is computable (even more, it is initial in PRIM)

<https://powcoder.com>
Add WeChat powcoder

Prove that: If A is computable, then it is c.e. (decidable \gg listable)

Proof1:

I_A is computable (given).

Recall: a set is c.e. if it is empty or is the range of a computable function.

If A is empty, then it is c.e. (implication holds by definition).

Assignment Project Exam Help

<https://powcoder.com>

Assume $A \neq \emptyset$. We want to find a computable function f such that $\text{range}(f) = A$.

Add WeChat powcoder

Since A is non-empty, there must be some $a \in A$. Fix such an a .

Let f be the function defined as follows

$$f(x) = \begin{cases} x & \text{if } I_A(x) = 1 \\ a & \text{if } I_A(x) = 0 \end{cases}$$

Proof2:

We describe a program that enumerates A which by CT can be mimicked by a Turing machine.

$i = 0$

Assignment Project Exam Help

$c = 0$

<https://powcoder.com>

While $i \neq 0$:

Add WeChat powcoder

if $I_A(c) = 1$: #this runs a sub-program

print(c)

$c = c + 1$

C.E. but not Computable (FINALLY)

Let $K = \{x: \varphi_x(x) \downarrow\}$

Assignment Project Exam Help

- Show that K is c.e. (Think)

<https://powcoder.com>

- Show that K is NOT computable

Add WeChat powcoder

- Assume towards a contradiction that K is computable.
- Consider the following function:

$$f(x) = \begin{cases} \text{undefined} & \text{if } x \in K \\ 0 & \text{otherwise} \end{cases}$$

<https://powcoder.com>

This f is partial computable because it can be mimicked by a TM:

1. we can computably decide if x is in K or not.
2. If x is in K , go in an infinite loop
3. If x is not in K , output 0

- But then, f must have a Gödel number, say e . I.e. $f = \varphi_e$

- If $e \in K$, then $\varphi_e(e) = f(e) \uparrow$ i.e. $e \notin K$ (contradiction)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- If $e \notin K$, then $\varphi_e(e) = f(e) = 0$ i.e. $\varphi_e(e) \downarrow$ i.e. $e \in K$ (contradiction)

Assignment Project Exam Help
What can you say about \bar{K} ?
<https://powcoder.com>

Add WeChat powcoder

Remarks

- There are uncountably many non-computable subsets of \mathbb{N}

Assignment Project Exam Help

- This is because there are only countably many computable sets (why?)

<https://powcoder.com>

Add WeChat powcoder

- The same applies to the bigger class of c.e. sets. There are only countably many such sets.
- This means that the class of c.e. sets is very small

More about c.e. sets

- We defined a set to be c.e. if it is empty or the range of a computable function

Assignment Project Exam Help

- One can also show it is the range of a partial computable function (exercise)

<https://powcoder.com>

Add WeChat powcoder

- One can also show it is the **domain** of a partial computable function
- All are equivalent definitions

Proof:

Let A be a c.e. set

If A is empty, then A is the domain of the empty function given by the program which doesn't halt on any input

<https://powcoder.com>

If A is not empty, then it is the range of a computable function, say $A = \{f(0), f(1), f(2), \dots\}$.

Let $\varphi(x) = \mu y[f(y) = x]$. Then $\text{dom}(\varphi) = A$

Computable Relations

- Recall, a binary relation over sets X, Y is a subset of the Cartesian product
$$X \times Y$$

Assignment Project Exam Help

- More generally, an n -ary relation over sets X_1, \dots, X_n is a subset of
$$X_1 \times \dots \times X_n$$

Add WeChat powcoder

- An n -ary relation on \mathbb{N} is one for which $X_1 = \dots = X_n = \mathbb{N}$
- A relation on \mathbb{N} is computable if it is computable as a set
- We say a relation is c.e. if it is c.e. as a set.

Example

- $R = \{(x, y, z) \in \mathbb{N}^3 : x < y \text{ and } z = 2x\}$

We have $R(1,2,2), R(0,3,0), R(10,11,20)$

But $\neg R(0,2,2), \neg R(0,0,0), \neg R(10,11,11)$

Here \neg means negation

- R is clearly computable. There's a program which when given any tuple (a, b, c) it can decide if $R(a, b, c)$ or $\neg R(a, b, c)$
- Note that we can regard relations as Boolean valued functions

- $R_2 = \{(x, e) \in \mathbb{N}^2: \varphi_e(x) \downarrow\}$

Not computable (why?)

Assignment Project Exam Help

<https://powcoder.com>

But it is c.e. because if $R_2(x, e)$ then you can confirm that computably

Add WeChat powcoder

Special Cases

- Note that a function is a binary relation

Assignment Project Exam Help

- A non-empty subset of X is a unary (1-ary) relation on X .

<https://powcoder.com>

- There are 0-ary relations (TRUE and FALSE)

Add WeChat powcoder

- There is the empty relation \emptyset which is the same as FALSE (holds for nothing)

Deeper analysis of $\varphi_e(x) \downarrow$

- Recall that $\varphi_e(a) \downarrow$ means that the partial computable function φ_e is defined at a , or equivalently, that the program P_e halts when given a as an input

Assignment Project Exam Help

<https://powcoder.com>

- Consider now the following new notation $\varphi_{e,s}(x) \downarrow$. It means the computation halts within s steps (or stages)

Add WeChat powcoder

- $\varphi_e(x) \downarrow$ iff $\exists s \varphi_{e,s}(x) \downarrow$

- Note that, for any fixed s the relation $\{(e, x): \varphi_{e,s}(x) \downarrow\}$ is computable unlike $\{(e, x): \varphi_e(x) \downarrow\}$ as we mentioned before

- Actually, the following ternary relation is computable

Assignment Project Exam Help

<https://powcoder.com>

- In general, one can prove that:

Add WeChat powcoder

A relation $R(x, y)$ is c.e. iff there exists a computable relation $C(a, x, y)$ such that for all x, y

$$R(x, y) \iff \exists a C(a, x, y)$$

The Arithmetical Hierarchy

- We use Σ_1^0 to denote the class of relations (formulas) obtained as $\exists \bar{a} C(\bar{a}, \bar{x})$ using some computable relation C
Assignment Project Exam Help
- Π_1^0 denotes the class of relations (formulas) obtained as $\forall \bar{a} C(\bar{a}, \bar{x})$ using some computable relation C
<https://powcoder.com>
Add WeChat powcoder
- Note that if a set is Σ_1^0 then its complement is Π_1^0 , and vice versa

Going higher

- Π_2^0 denotes the class of relations (formulas) obtained as $\forall \bar{a} \exists \bar{b} C(\bar{a}, \bar{b}, \bar{x})$ using some computable relation C
Or equivalently $\forall \bar{a} D(\bar{a}, \bar{x})$ for some Σ_1^0 relation D
- Σ_2^0 denotes the class of relations (formulas) obtained as $\exists \bar{a} \forall \bar{b} C(\bar{a}, \bar{b}, \bar{x})$ using some computable relation C

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

In general

- Π_{n+1}^0 denotes the class of relations (formulas) obtained as $\forall \bar{a} D(\bar{a}, \bar{x})$ for some Σ_n^0 relation D
Assignment Project Exam Help
- Σ_{n+1}^0 denotes the class of relations (formulas) obtained as $\exists \bar{a} D(\bar{a}, \bar{x})$ for some Π_n^0 relation D
<https://powcoder.com>
Add WeChat powcoder
- Note that, for all n , $\Sigma_n^0 \cup \Pi_n^0 \subsetneq \Sigma_{n+1}^0 \cap \Pi_{n+1}^0$

- Recall we mentioned that

A relation $R(x, y)$ is c.e. iff there exists a computable relation $C(a, x, y)$ such that for all x, y

$$R(x, y) \Leftrightarrow \exists a C(a, x, y)$$

<https://powcoder.com>

- This means that C.E. = Σ_1^0
- BTW, Computable = $\Sigma_0^0 = \Pi_0^0$

The Normal Form Theorem for C.E. Sets

- The following are equivalent:

Assignment Project Exam Help

- A is c.e.

<https://powcoder.com>

- A is Σ_1^0

- $A = W_e$ for some $e \in \mathbb{N}$

Add WeChat powcoder

Relative Computability

- We have just seen that C.E. = Σ_1^0

Assignment Project Exam Help

- How about Σ_2^0 ? Or more generally, Σ_{n+1}^0 ?

<https://powcoder.com>

- Are they c.e. in some sense w.r.t. some higher level?

Add WeChat powcoder

- Indeed, it is all about the computable function which enumerates the set

Oracle Machines and Relative Computability

- A set A is Σ_2^0 means that it is either empty or the range of a Σ_1^0 function f

Assignment Project Exam Help

- More clearly, f can be computed with a program which has access to, e.g., the set K we described earlier
- Such program is given the knowledge of the indicator function of K

<https://powcoder.com>

Add WeChat powcoder
